## 1. OVERVIEW

### 1.1 Background

CMOC Mining Services Pty Limited (CMOC) is the manager of the Northparkes Joint Venture, an unincorporated joint venture between CMOC Mining Limited (80%); Sumitomo Metal Mining Oceania Pty Ltd (13.3%) and SC Mineral Resources (6.7%). Northparkes is a copper-gold operation in Goonumbla, situated 27 kilometres north-west of the town of Parkes.

Construction of the ore processing plant and associated facilities began in 1993. Open cut mining commenced on the E22 and E27 ore bodies in late 1993. Development of the E26 lift 1 block cave underground mine began in 1994, with full scale production commencing in 1997.

### 1.2 Mining Context

Operations at Northparkes primarily comprises underground mining from multiple ore sources that feed a processing plant with a capacity of 6½ million tonnes per annum (Mtpa). The underground mine is accessed via a decline ramp from the surface for people and materials with ore transported to the surface via inclined conveyors and a hoisting shaft, with a nominal capacity of 7.2 Mtpa. Northparkes utilises low cost block and sub-level cave mining and exploits industry leading technology, such as semi-autonomous loaders and various cave monitoring systems.

The ore processing operation consists of four stages: crushing, grinding, flotation and thickening / filtering. In addition to producing concentrate, the ore processing team also manages tailings disposal. The concentrator was constructed in two modules. Each module consists of its own grinding circuit with a single flotation circuit, concentrate thickener and filter. After extracting the copper and gold bearing minerals, the tailings are combined in a single tailings thickener before being deposited in the active tailings storage facility.

Northparkes' copper concentrate is transported to a rail siding where it is then transported by rail to Port Kembla, for shipping to overseas customers.

### 1.3 Rehabilitation

Rehabilitation at Northparkes incorporates the entire landholding and not just the area covered by the mining leases. Northparkes own and manage approximately 6,370ha of surrounding agricultural land that acts as a buffer zone for the operations.

Progressive rehabilitation conducted onsite is integrated with the surrounding Northparkes owned land and is managed with a view to enhancing the regional landscape and native habitat values. These areas are primarily identified through the Site Disturbance Permit (SDP) process which is on a project based frequency. In addition, six monthly reviews by the environment team in conjunction with the farm manager and relevant mine planning personnel occur to identify additional opportunities for progressive rehabilitation.

In addition to these areas, large areas of remnant forest within the agricultural land, particularly along Bogan River, Goonumbla Creek and the ridgelines on the "Rosedale" and "Rocklands" properties, are enhanced to increase biodiversity and landscape function.

Rehabilitation activities are designed to be safe, stable and non-eroding.

All activities align with the Northparkes Mining Operations Plan. Large scale rehabilitation typically occurs on constructed landforms such as waste rock dumps, tailings storage facilities, topsoil stockpiles and other disturbed areas.

### 1.4 Regulatory Requirements

The Rehabilitation Management Plan (RMP) addresses the relevant components of conditions 39 – 41 of the NSW Development Consent 11\_0060. These conditions are outlined in below.

#### Table 1: Legal Requirements

Doc No. PLN-0060	Version No. 14	Next Review Date 2/07/2022	Owner Environment & Farms Superintendent
---------------------	-------------------	-------------------------------	--

Condition	Related Section in NMP																		
<b>Rehabilitation Objectives</b>																			
<p>1. The proponent shall rehabilitate the site to the satisfaction of NSW Trade &amp; Investment. This rehabilitation must be generally consistent with the proposed rehabilitation strategy described in the EA (and depicted conceptually in the figures in Appendix 9), and comply with the objectives in Table below.</p> <table border="1"> <thead> <tr> <th style="background-color: #cccccc;">Feature</th> <th style="background-color: #cccccc;">Objective</th> </tr> </thead> <tbody> <tr> <td>Mine Site (as a whole)</td> <td> <ul style="list-style-type: none"> <li>- safe, stable and non-polluting</li> <li>- constructed landforms drain to the natural environment (excluding final voids and subsidence areas)</li> <li>- minimise visual impact of final landforms as far as is reasonable and feasible</li> </ul> </td> </tr> <tr> <td>Agricultural Areas</td> <td> <ul style="list-style-type: none"> <li>- land is returned to a condition that sustains agricultural land use to at least the original rural land capability and agricultural productivity and requires a level of management that is comparable to adjacent agricultural areas</li> </ul> </td> </tr> <tr> <td>Final Voids and Subsidence Zones</td> <td> <ul style="list-style-type: none"> <li>- minimise the size and depth of the final voids and subsidence zones so far as is reasonable and feasible</li> <li>- minimise the drainage catchment of the final voids and subsidence zones so far as is reasonable and feasible</li> <li>- negligible high wall instability risk</li> <li>- restrict access</li> <li>- re-vegetate areas surrounding final voids and subsidence zones to minimise erosion</li> <li>- minimise risk of flood interaction for all flood events up to and including the Probable Maximum Flood level</li> </ul> </td> </tr> <tr> <td>Tailings Storage Facilities</td> <td> <ul style="list-style-type: none"> <li>- any seepage from TSFs to be contained and treated on the site</li> <li>- filled and shaped to final landform levels</li> <li>- final landforms to be capped and re-vegetated to be stable, self-sustaining, free draining and consistent with surrounding rehabilitated areas</li> </ul> </td> </tr> <tr> <td>Waste Rock Dumps</td> <td> <ul style="list-style-type: none"> <li>- any seepage from waste rock dumps to be contained and treated on the site</li> </ul> </td> </tr> <tr> <td>Surface infrastructure</td> <td> <ul style="list-style-type: none"> <li>- to be decommissioned and removed, unless the Executive Director, Mineral Resources agrees otherwise</li> </ul> </td> </tr> <tr> <td>Native Vegetation</td> <td> <ul style="list-style-type: none"> <li>- re-vegetation is to be sustainable for the long term, contains native vegetation communities, second generation trees and habitat for native fauna species</li> </ul> </td> </tr> <tr> <td>Community</td> <td> <ul style="list-style-type: none"> <li>- ensure public safety</li> <li>- minimise adverse socio-economic effects associated with mine closure</li> </ul> </td> </tr> </tbody> </table>	Feature	Objective	Mine Site (as a whole)	<ul style="list-style-type: <b>Progressive Rehabilitation</b>																			
<p>2. The Proponent shall rehabilitate the site progressively as soon as reasonably practicable following disturbance. All reasonable and feasible measures must be taken to minimise the total area exposed for dust generation at any time. Interim rehabilitation strategies shall be employed when areas prone to dust generation cannot be permanently rehabilitated.</p> <p><b>Note:</b> It is accepted that some parts of the site that are progressively rehabilitated may be subject to further disturbance at some later stage of the project.</p>	Section 5																		
<b>Rehabilitation Management Plan</b>																			
<p>3. The Proponent shall prepare and implement a Rehabilitation Management Plan for the project to the satisfaction of NSW Trade &amp; Investment. This plan must:</p> <ol style="list-style-type: none"> <li>a) be prepared in consultation with Planning &amp; Infrastructure, DPI Water, OEH, Council and the CCC</li> <li>b) be submitted to NSW Trade &amp; Investment for approval by 30 June 2014, unless the Secretary agrees otherwise</li> <li>c) be prepared in accordance with any relevant NSW Trade &amp; Investment guideline</li> <li>d) describe how the rehabilitation of the site would be integrated with the implementation the biodiversity offset strategies</li> <li>e) include detailed performance and completion criteria for evaluating the performance of the rehabilitation of the site against the rehabilitation objectives in Table 8, and triggering remedial action (if necessary)</li> </ol>	Sections 6 & 7																		

Doc No. PLN-0060	Version No. 14	Next Review Date 2/07/2022	Owner Environment & Farms Superintendent
---------------------	-------------------	-------------------------------	--

Condition	Related Section in NMP
f) describe the measures that would be implemented to ensure compliance with the relevant conditions of this approval, and address all aspects of rehabilitation including mine closure, final landform, and final land use g) include interim rehabilitation where necessary to minimise the area exposed for dust generation h) include a program to monitor, independently audit and report on the effectiveness of the measures, and progress against the detailed performance and completion criteria i) build to the maximum extent practicable on the other management plans required under this approval	

## 2. SCOPE

This document applies to all activities undertaken by Northparkes including mining and exploration activities, processing of copper / gold ore resources, project development, maintenance activities, mine closure, logistics, associated service and support functions, bore fields, farming operations and products.

This document encompasses all operational and non-operational areas both on and off the Northparkes mining leases (ML1247, ML1367, ML1641 and ML1743). This includes the surrounding farm land and offset sites owned and managed by Northparkes operations. Progressive rehabilitation conducted onsite is integrated with the surrounding Northparkes owned land and is managed with a view to enhancing the regional landscape and native habitat values.

It is to be utilised for operations and projects that require the rehabilitation of land once finalised or finished and also encompasses progressive rehabilitation and habitat enhancement. The rehabilitation strategy is consistent with the Northparkes closure strategy which is described in the closure management plan.

## 3. PURPOSE / OBJECTIVES

The objectives of the Rehabilitation Management Plan (RMP) are:

**Table 2: Objectives**

Feature	Objective
Mine Site (as a whole)	<ul style="list-style-type: none"> <li>– safe, stable and non-polluting</li> <li>– constructed landforms drain to the natural environment (excluding final voids and subsidence areas)</li> <li>– minimise visual impact of final landforms as far as is reasonable and feasible</li> </ul>
Agricultural Areas	<ul style="list-style-type: none"> <li>– land is returned to a condition that sustains agricultural land use to at least the original rural land capability and agricultural productivity and requires a level of management that is comparable to adjacent agricultural areas</li> </ul>
Final Voids and Subsidence Zones	<ul style="list-style-type: none"> <li>– minimise the size and depth of the final voids and subsidence zones so far as is reasonable and feasible</li> <li>– minimise the drainage catchment of the final voids and subsidence zones so far as is reasonable and feasible</li> <li>– negligible high wall instability risk</li> <li>– restrict access</li> <li>– re-vegetate areas surrounding final voids and subsidence zones to minimise erosion</li> <li>– minimise risk of flood interaction for all flood events up to and including the Probable Maximum Flood level</li> </ul>
Tailings Storage Facilities	<ul style="list-style-type: none"> <li>– any seepage from TSFs to be contained and treated on the site</li> <li>– filled and shaped to final landform levels</li> <li>– final landforms to be capped and re-vegetated to be stable, self-sustaining, free draining and consistent with surrounding rehabilitated areas</li> </ul>
Waste Rock Dumps	<ul style="list-style-type: none"> <li>– any seepage from waste rock dumps to be contained and treated on the site</li> </ul>
Surface infrastructure	<ul style="list-style-type: none"> <li>– to be decommissioned and removed, unless the Executive Director, Mineral Resources agrees otherwise</li> </ul>

Doc No. PLN-0060	Version No. 14	Next Review Date 2/07/2022	Owner Environment & Farms Superintendent
---------------------	-------------------	-------------------------------	--

Feature	Objective
Native Vegetation	– re-vegetation is to be sustainable for the long term, contains native vegetation communities, second generation trees and habitat for native fauna species
Community	– ensure public safety – minimise adverse socio-economic effects associated with mine closure

These objectives will vary depending on the site and in regard to the agreed final land use. For this reason, it is essential that rehabilitation objectives be agreed upon with all relevant stakeholders to establish realistic goals. Progress on these goals will be monitored and reported to relevant internal and external stakeholders.

## 4. RESPONSIBILITIES

General role responsibilities are outlined in the Health, Safety and Environment Responsibilities and Accountabilities Procedure (PRO-0080). Personnel carrying out work under this document must be familiar with and comply with it in full. The following persons have specific responsibility:

**Table 3: Responsibilities**

Role	Responsibility
All Workers	<ul style="list-style-type: none"> <li>– are responsible for identifying hazards with this document and initiating management of change to correct those deficiencies</li> <li>– are responsible for complying with all associated processes, procedures and instructions that support this document</li> </ul>
Environment Team	<ul style="list-style-type: none"> <li>– must review this document for effectiveness and its performance against its objective/s</li> <li>– ensure identified areas for rehabilitation are progressed in a timely manner and in accordance with this management plan</li> <li>– ensure rehabilitation is undertaken in accordance with the management measures as described in Table 5</li> <li>– maintain existing remnant vegetation and link through wildlife corridors, wherever possible.</li> <li>– monitor and review progress against operational rehabilitation success indicators. Apply corrective measures as necessary.</li> <li>– review rehabilitation monitoring results and apply control measures as necessary.</li> <li>– display summary of monitoring results on website and make available at the mine.</li> <li>– maintain and co-ordinate reporting for the monitoring program.</li> </ul>
Environment Superintendent	<ul style="list-style-type: none"> <li>– report against performance criteria in the Annual review (AR).</li> <li>– report complaints and outcomes of investigations in the AR.</li> <li>– manage activities on site in accordance with this management plan.</li> </ul>
Farm Manager	<ul style="list-style-type: none"> <li>– implement bushfire prevention and control measures in accordance with Table 2.</li> <li>– undertake pest and weed control across the mine lease.</li> </ul>
PSE Manager	<ul style="list-style-type: none"> <li>– integrate rehabilitation with surrounding landholding to enhance the regional landscape and native habitat values.</li> <li>– maintain buffer zone around the mine lease to minimise visual impact.</li> <li>– revegetate, monitor and maintain the Limestone National Forest offset area prior to hand over to Forestry NSW.</li> <li>– undertake Aboriginal Community consultation as necessary.</li> <li>– review and update landscape and rehabilitation completion criteria in line with mine closure planning process.</li> <li>– ensure any incidents which trigger reporting legislation are reported immediately.</li> </ul>
Department Managers	<ul style="list-style-type: none"> <li>– ensure relevant personnel and contractors within their responsibility are aware of and comply with this Management Plan.</li> <li>– monitor the implementation and use of this standard in their department and implement corrective action for any deviations found.</li> </ul>
Managing Director	<ul style="list-style-type: none"> <li>– must review this document for effectiveness and its performance against its objective/s</li> <li>– ensure that the system and this Management Plan are consistent with CMOC Standards, the site HSEQMS and meets the requirements of relevant legal obligations.</li> </ul>

Doc No. PLN-0060	Version No. 14	Next Review Date 2/07/2022	Owner Environment & Farms Superintendent
---------------------	-------------------	-------------------------------	--

## 5. KEY ISSUES

### 5.1 Potential Impacts

The risks and potential impacts associated with this RMP are detailed in but not limited to the aspects contained in Table 4. Risks and potential impacts will directly affect the success towards the completion criteria contained in Table 7 and Table 8 of this RMP, in addition to the health and safety of the community and surrounding environment.

**Table 4: Potential Impacts**

Risk / Impact	Description
Biodiversity Loss	Reduction in biodiversity value of rehabilitated area due to inability to replace lost habitat and communities.
Erosion	Erosion due to failure of rehabilitation causes risks to human safety, potential runoff and contamination of water courses.
Contamination	Rehabilitation fails due to inability to adequately consider risks of mineral waste resulting in contamination release Failure to properly rehabilitate exposed areas of waste rock/soil result in Acid Rock Drainage (ARD) generation and heavy metal mobility affecting ground/surface water and soil.
Landform Stability	Stability of landforms on site is reduced due to inadequate rehabilitation and ground cover, posing risks to community and surrounding environment.
Species Richness	Poor planning and incorrect species selection results in dominance of unwanted plant species.
Compliance	Failure to meet legislated rehabilitation requirements within Table 1.
Visual Amenity	Failure to consider surrounding landscape and community expectations in landform design results in detrimental impact on visual amenity.
Dust Generation	Failure to establish adequate ground cover through rehabilitating prioritised areas results in excess dust generation and topsoil loss.
Soil Fertility	Failure to rehabilitate areas limiting the stability, infiltration and nutrient cycling capacity of the soil directly affecting physical and chemical fertility.
Fragmentation	Habitat fragmentation occurs resulting in loss of species diversity and richness, accelerating edge effects.

Doc No. PLN-0060	Version No. 14	Next Review Date 2/07/2022	Owner Environment & Farms Superintendent
---------------------	-------------------	-------------------------------	--

## 6. MANAGEMENT

The short, medium and long term management measures to be implemented to rehabilitate the site are described in the following table.

**Table 5: Rehabilitation Management Measures**

Aspect	Measures	Responsibility	Frequency
Site Disturbance	Prior to the disturbance of any areas, a site disturbance form must be completed and approved by the Environment Section in accordance with the Site Disturbance PRO (PRO-0100). The form identifies any potential environmental issues associated with the disturbance and control measures to be undertaken. The boundaries of the disturbance areas will be clearly identified to minimise the extent of clearing. No clearing will occur outside these boundaries without additional consultation with the Environment Section.	All personnel.	As required.
Revegetation	To be designed for erosion control, aesthetic improvement and ecosystem regeneration. This is to be undertaken on all constructed landforms and revegetation activities. Depending on the proposed land use, this will involve direct seeding or planting of selected shrub, grass and tree species. Sowing and planting is dependent on seasonal factors and will be scheduled, where possible, in autumn or early winter.	Project owner and Environment Team	As required.
Seed Collection	Coordinated through local suppliers. Species for revegetation will be native and endemic to the area, where possible. Information can be derived from DECC. (2006). Reconstructed and Extant Distribution of Native Vegetation in the Central West Catchment.; and Sydes, M., Butterfield, L. and Rutledge, S. (2006). A Practical Guide to Revegetation in the Mid Lachlan Region.	Environment Team	As required.
Planting	Establishment of grass species onsite is undertaken either by: Hydroseeding and mulching; Tractor and cultivator; or Aerial seeding. In establishing revegetation corridors (~50m wide), tube stock is hand planted in rip lines at approximately 4-6m spacing.	Project owner and Environment Team	As required.
Pre-Clearance Surveys	Where required, a pre-clearing survey would be undertaken by a relevantly trained person to target particular threatened species known or potentially occurring in the area and identify any critical habitat within the clearing areas for these species. Determination of need for survey will be made by the Environment Dept. Impact management will be undertaken in accordance with: <ul style="list-style-type: none"> <li>• Flora and Fauna Management Plan (PLN-0047)</li> <li>• Site Disturbance Procedure (PRO-0100)</li> </ul>	Project owner and Environment Team	As required.
Progressive Rehabilitation	Progressive rehabilitation conducted onsite is integrated with the surrounding Northparkes owned land and is managed with a view to enhancing the regional landscape and native habitat values. These areas are primarily identified through: <ul style="list-style-type: none"> <li>• Site Disturbance Permit (SDP) process which is on a project based frequency.</li> <li>• Annual reviews by the environment team in conjunction with the farm manager and relevant mine planning personnel.</li> </ul>	Farms Manager, mine planning personnel and Environment Team.	Annually
Interim Rehabilitation	Where possible, interim rehabilitation (sowing of crops) could be undertaken on inactive tailings dam surfaces to minimise the area exposed for dust generation, before closure.	Project owner and Environment Team	As required.
Flora and Fauna	Where practical, clearing within woodland communities would be timed to avoid more sensitive breeding, torpor and dispersal periods of the year. Where it is not practical to clear during these times, the pre-clearance survey would minimise the potential impact on these species. All management strategies implemented to minimise impacts on fauna will be undertaken in accordance with the Flora and Fauna Management Plan (PLN-0047).	Project owner and Environment Team	As required.
Salvaging and Reuse of Material for Habitat Enhancement	Vegetation that is cleared may be placed on rehabilitated areas for habitat enhancement. Cleared native vegetation will be removed whole and placed on progressively rehabilitated areas or within the revegetation areas. This will assist to reduce erosion, disperse seed and provide fauna habitat. Where practical, removed hollow-bearing trees will be resited in a suitable location within the Mining lease	Project owner and Environment Team	As required.

Doc No. PLN-0060	Version No. 14	Next Review Date 2/07/2022	Owner Environment & Farms Superintendent
---------------------	-------------------	-------------------------------	--

Aspect	Measures	Responsibility	Frequency
Soil management	Topsoil and subsoil is stripped and stockpiled for later use in rehabilitation in accordance with the Topsoil Management Plan (PLN-0055). Topsoil stockpiles are seeded, marked with signage and surveyed. Topsoil is spread on the shaped area to a minimum depth of 100mm and ripped to allow maximum water infiltration and seed germination.	Project owner and Environment Team.	As required.
Remnant Vegetation and Habitat	Ongoing revegetation plans aim to provide appropriate linkages between areas of adjoining vegetation and wildlife corridors to enhance ecosystem function. Wildlife corridors are established or improved along fence lines, road verges, creeks and drainage lines.	Farms Manager and Environment Team.	As required.
Visual Impact	A buffer zone is maintained around the mine site to minimise impact of the operations on surrounding residences. This buffer zone is managed as a mixture of agricultural land and revegetation areas. Mitigation measures to minimise visual intrusion of the operations include: <ul style="list-style-type: none"> <li>• maintenance of existing vegetation where possible for visual screening, including infill planting where necessary</li> <li>• establishment of revegetation corridors outside the active mine area</li> <li>• ensuring that areas of disturbance are kept to a minimum at any one point in time</li> <li>• progressive rehabilitation on disturbed areas is undertaken as soon as practical</li> <li>• direction of lighting onsite to minimise impacts to neighbouring properties and road users</li> </ul>	Farms Manager and Environment Team.	As required.
Pest and Weed Control	Control of feral animals is undertaken on an as needs basis and is achieved by trapping or baiting. Feral animal control is conducted in consultation with the Local Land Service (LLS). Weed control is undertaken to limit the spread and colonisation of noxious and environmental weeds. Weed control methods include: <ul style="list-style-type: none"> <li>• ongoing surveillance and reporting</li> <li>• management of topsoil stockpiles to limit weed proliferation and spread</li> <li>• strategic crop rotation, fallow, slashing and controlled burning (where necessary) on agricultural lands</li> <li>• limiting vehicle access to rehabilitated areas</li> <li>• chemical spraying with approved herbicides</li> <li>• physical removal by manual chipping</li> </ul>	Farms Manager and Environment Team.	As required.
Bushfire Management	Bushfire prevention and control measures implemented include: <ul style="list-style-type: none"> <li>• firefighting training and awareness provided to relevant personnel, including an onsite Emergency Response Team</li> <li>• provision and maintenance of onsite firefighting equipment</li> <li>• permits for hot work are issued before commencement of works in accordance with the Hot Work Permit PRO (PRO-0143)</li> <li>• appropriate management of hazardous materials</li> <li>• maintenance of designated firebreaks by a combination of grading and spraying</li> <li>• consultation with the NSW Fire Brigade and Rural Fire Service, as required</li> </ul> If bushfire management requires the clearance of vegetation the Site Disturbance Procedure (PRO-0100) will be implemented.	Emergency response Team and Environment Team.	As required.
Aboriginal Heritage	A consultative process has been established to discuss rehabilitation activities that pertain to matters of Aboriginal heritage management and address any issues raised. Further detail on consultation with local aboriginal groups is provided in the Cultural Heritage Management Plan (PLN-0074)	Communities and External Relations Team and Environment Team.	As required.

Doc No. PLN-0060	Version No. 14	Next Review Date 2/07/2022	Owner Environment & Farms Superintendent
---------------------	-------------------	-------------------------------	--

Aspect	Measures	Responsibility	Frequency
Sustainable Agricultural	Cropping is undertaken within large paddocks, divided by tree lines acting as connected wildlife corridors. All stock has been removed from the area to reduce erosion, compaction and improve regeneration of tree lines. The farming practices implemented include; soil conservation works, conservation tillage practices, stubble retention and an absence of livestock grazing, has contributed to the absence of visible land degradation through erosion and has improved soil quality. Additionally, large areas of remnant forest areas within the agricultural land, particularly along Bogan River, Goonumbla Creek and the ridgelines on the "Rosedale" and "Rocklands" properties, are enhanced to increase biodiversity and landscape function.	Farms Manager and Environment Team.	As required.
Native Habitat Enhancement	Northparkes has, wherever possible, been able to maintain large sections of remnant vegetation within its landholding. An important component of the rehabilitation strategy is the development and implementation of re-vegetation plans that link the significant areas of remnant vegetation with wildlife corridors and enhance ecological value.  The linking of remnant vegetation aims to produce sustainable native ecosystems within the agricultural landscape thereby assisting to conserve biodiversity and maintain evolutionary potential.	Farms Manager and Environment Team.	Annually.

## 7. PERFORMANCE CRITERIA

Rehabilitation programmes are intrinsically linked to the mine closure planning process in which post-mining landforms and land uses are identified. Accordingly, rehabilitation completion criteria need to assess whether planned post-mining landforms and land uses have been achieved. Presently, Northparkes envisages a post-mining landscape that comprises a mixture of landforms and land uses, including:

- Voids that will primarily be managed to minimise safety exposures;
- Land capable of supporting agricultural cropping production;
- Land capable of supporting agricultural broad acre grazing; and
- Native vegetation conservation and management.

Rehabilitation completion criteria set benchmarks for a suite of parameters that need to be met to demonstrate that rehabilitation has been successful, or is considered sustainable. Northparkes is committed to meeting legislative requirements and industry policies for the decommissioning of sites and closure practices.

Rehabilitation completion criteria identified in Table 7 and Table 8 have been established to define repeatable and consistent methodologies for monitoring changes in various aspects of ecosystem function, succession and long-term sustainability. Part of this process included:

- Establishing a range of relevant reference sites to compare and track the progress and inherent ecosystem function of rehabilitation areas;
- Selecting a range of suitable reference sites that reflect the desired final land use, biodiversity targets, historical disturbances and local community expectations; and
- Undertaking a monitoring program that provides simple but informative and reliable information that indicates positive recovery trends or rapid detection of rehabilitation failure.

The criteria in Table 7 and Table 8 have been developed using in field testing and look to incorporate biodiversity values of relevant reference sites. These criteria have not been agreed on and signed as the final proposed completion criteria with all relevant stakeholders, therefore should be considered preliminary and subject to review under routine adaptive management practices.

A framework for landscape and rehabilitation completion criteria in a range of environmental themes has been proposed in Table 6.

**Table 6: Proposed framework for landscape and rehabilitation completion criteria**

Doc No. PLN-0060	Version No. 14	Next Review Date 2/07/2022	Owner Environment & Farms Superintendent
---------------------	-------------------	-------------------------------	--

Environmental Theme	Criteria	Timeframe
Land use Planning	Final land use agreed across the mine footprint with key stakeholders	Medium – Long Term (5 years to mine closure)
	Land use plan identifies suitable areas for cropping, broad acre grazing and native vegetation protection and establishment	Medium – Long Term
Maintenance of Existing Environmental Assets	Management plans implemented and reviewed for management of environmental assets	Ongoing
	Clearing of native vegetation minimised	Ongoing
	Appropriate flora and fauna surveys completed before any clearing occurs	Ongoing
	Existing remnant vegetation monitored for extent and condition	Ongoing
	Key flora and fauna species monitored in areas of remnant vegetation	Ongoing
	Introduced plant and animal populations appropriately managed	Ongoing
Rehabilitation Planning	Landscape rehabilitation plan agreed amongst project stakeholders	Medium – Long Term
	Ongoing rehabilitation activities monitored to improve local practices	Ongoing
Landform Design & Stability	Landforms designed to minimise impact on visual amenity and blend with surrounding landscape	Ongoing – Long Term
	All possible infrastructure removed from the landscape post-mining	Long Term
	Batter slopes stable	Ongoing
	Erosion minimised	Ongoing
	Subsidence and pit slopes are stable	Ongoing and post Mine Closure
Final Void Management	An appropriate Final Void Management Plan agreed with key stakeholders	Medium – Long Term
Generic Vegetation Establishment	An adequate growth medium profile is developed	Ongoing – Long Term
	A perennial vegetation groundcover is established	Ongoing – Long Term
Cropping Land Establishment	Cropping land yield returns are similar to nearby properties	Medium – Long Term
	Cropping returns are sustainable	Long Term
Broad acre Grazing Land Establishment	Broad acre pasture return have similar yields to nearby properties	Long Term
	Grazing returns are sustainable	Long Term
	Weed and feral animal populations appropriately managed	Long Term
Native Vegetation Establishment	Rehabilitation inputs monitored and reported	Ongoing – Long Term
	A realistic goal community defined for each site with consideration of biophysical constraints and opportunities	Medium – Long Term
	Canopy cover, stem density and other structural attributes established at appropriate levels similar to local reference communities or benchmarks	Medium – Long Term
	Weed and feral animal populations appropriately managed	Ongoing – Long Term
	An appropriate species mix used in re-vegetation programs to establish desired communities	Ongoing – Long Term
	An appropriate species composition established compared to reference communities	Long Term
	Fauna has re-colonised vegetation such that habitat use is similar to reference communities	Long Term
	Rehabilitated site resilient to natural disturbance (e.g. fire)	Long Term

---------------------	-------------------	-------------------------------	--

Hierarchy of ecosystem succession	Aspect or ecosystem component	Completion criteria	Performance indicators	Completion performance indicators description
Performance indicators are quantified by the range of values obtained from replicated reference sites				
Landform establishment and stability	Landform function	Landform is functional and performing as it was designed to do	LFA Stability	Based on key physical, biological and chemical characteristics the LFA stability index provides an indication of the sites stability and that it is comparable to or trending towards that of the local remnant vegetation
			LFA Infiltration	Based on key physical, biological and chemical characteristics the LFA infiltration index provides an indication of the sites infiltration capacity and that it is comparable to or trending towards that of the local remnant vegetation
			LFA Nutrient recycling	Based on key physical, biological and chemical characteristics the LFA nutrient recycling index provides an indication of the sites ability to recycle nutrient and that it is comparable to or trending towards that of the local remnant vegetation
			LFA Landscape organisation	The Landscape Organisation Index provides a measure of the ability of the site to retain resources and that it is comparable to that of the local remnant vegetation
	Active erosion	Areas of active erosion are limited	No. Rills/Gullies	Provides an assessment of the number of gullies or rills occurring in a 50m transect and that these are limited and stabilising
Growth medium development	Soil chemical, physical properties and amelioration	Soil properties are suitable for the establishment and maintenance of selected vegetation species	pH	pH is typical of that of the surrounding landscape or falls within desirable ranges provided by the agricultural industry
			Organic Matter	Organic Carbon levels are typical of that of the surrounding landscape, increasing or fall within desirable ranges provided by the agricultural industry
			Nitrate	Nitrate levels are typical of that of the surrounding landscape or fall within desirable ranges provided by the agricultural industry
Ecosystem & Landuse Establishment	Vegetation diversity	Vegetation contains a diversity of species comparable to that of the local remnant vegetation	Exotic richness species	The total number of live exotic plant species provides an indication of the exotic plant diversity of the site and that it is less than or comparable to the local remnant vegetation

## 8. MONITORING

The Mine Operating Plan requires land rehabilitation performance be monitored annually for the first five years following active rehabilitation of the area, then every three years over a nine year period. A decision for further monitoring of these sites will be made after this period of 12 years, depending on performance against relinquishment criteria.

Monitoring is to be undertaken by a suitably qualified ecologist, as to ensure vegetation is establishing and to determine the need for any maintenance and/or contingency measures.

The criteria this monitoring is conducted against are outlined in Table 7 and Table 8.

The monitoring program has been established to define repeatable and consistent methodologies for monitoring changes in various aspects of ecosystem function, succession and long-term sustainability.

Rehabilitation monitoring will occur in existing remnant vegetation, agricultural land and temporary rehabilitated areas. The monitoring of these sites (Figure 1 and Figure 2) will be conducted on a three-yearly basis against the criteria in Table 7 and Table 8.

Table 9 identifies the reference sites and rehabilitation sites that form the current monitoring program.

## 9. REPORTING

Northparkes Mines will report against the performance criteria outlined in this RMP in the Annual Review.

A copy of this RMP will be made publicly available at the mine and on Northparkes website in accordance with Condition 11, Schedule 6 of Development Consent 11\_0060. Also, a summary of monitoring results will be made publicly available at the mine and on the website, updated on a quarterly basis.

Incident reporting will be in accordance with Condition 7, Schedule 6 of Development Consent 11\_0060 and in line with the Incident Management Procedure (PRO-0148).
