### **DISCLAIMER:**

All works carried out in preparing this report have been conducted on a fully professional basis with due care and attention utilising ESP professional knowledge and understanding of relevant and current National and State Standards, Compliance Codes, Regulations and Acts. The findings of this report represent the professional opinion of the current workplace situation from experienced technicians, professional scientists and HS&E consultants.

This report should not be used as a contractual document. ESP does not provide any warranty, assurance or accept any liability as to the suitability of the report, or information contained in the report, as a contractual document. The use of the report as a contractual document is at the legal risk of the client.

This report relates to specific conditions existing at the time of undertaking the work. Current or future conditions of the areas reviewed may not be able to be assumed or inferred from information contained in this report.

### **REVISION HISTORY**

Revision	Revision Description	Issued	Recipient
1	<i>Final version</i>	11/7/2018	<i>N. Jones</i>

## EXECUTIVE SUMMARY

ESP – Environmental and Safety Professionals (ESP) – was commissioned by Northparkes Mines (NPM) to undertake Environmental Noise Assessments at four residential/farming properties (Hubberstone, Lone Pine, Milpose and Hillview) all within the vicinity of the NPM mine site. Monitoring was conducted to assess noise levels, resulting from NPM operations, at four key receivers around the site.

Attended noise monitoring was undertaken from the 20<sup>th</sup> to the 21<sup>st</sup> of June 2018.

Weather conditions during monitoring were favourable and adequate noise measurements were obtained for this period.

Attended noise monitoring results indicate noise emissions from the mine site comply with the Project Approval criteria during all monitoring periods.

## 1. INTRODUCTION

ESP was commissioned by Northparkes Mines (NPM) to undertake an Environmental Noise Assessment during Quarter 2, 2018 as part of their regular noise monitoring program in accordance with Project Approval 11\_0060.

This report presents:

- results of attended measurements from day, evening and night operation of the mine for the period from the 20<sup>th</sup> to the 21<sup>st</sup> June 2018;
- an assessment of the results against Project Approval 11\_0060 requirements and the criteria described in Northparkes Mine Step Change Project Approval.

## 2. BACKGROUND

The NPM site is located approximately 27 kilometres NNW of the town of Parkes, NSW.

ESP was asked to conduct attended monitoring at four locations as per the following table.

Location name	Type
Hillview	Residential & farming
Hubberstone	Residential & farming
Milpose	Residential & farming
Lone Pine	Residential & farming

**Table 1: Monitoring location and type**

A map showing monitoring locations in relation to the mine site is presented in Appendix A of this report.

### 3. NOISE LIMITS

#### Noise Management Plan

NPM has implemented a Noise and Vibration Management Plan (NVMP) which requires noise to be monitored at key locations adjacent to the mine site.

The NVMP requires that attended noise monitoring be conducted once per quarter for three consecutive 15-minute periods at each monitoring location for each of the day, evening and night time periods.

#### Project Specific Criteria

According to PA 11\_0060 and the Northparkes Mine Step Change Project Approval, the project specific criteria at each location are as follows:

Period		Project Specific Criteria dB*	
Day	0700 - 1800	$L_{Aeq(15min)}$	35
Evening	1800 – 2200	$L_{Aeq(15min)}$	35
Night	2200 – 0700	$L_{Aeq(15min)}$	35
		$L_{A1(1min)}$	45

Table 2: Project specific criteria for day, evening & night periods.

---

\* Note: All noise measurements are “A-weighted” sound pressure level measurements, hence, the notation “dB” has been used in this report without the additional qualifier “(A)” for purposes of brevity and readability.

## 4. NOISE LEVEL MEASUREMENT

### Methodology - Equipment

Attended noise measurements were carried out using a Rion Class 1 sound level meter.

Calibration details are attached in Appendix B.

The equipment used is listed below:

Equipment	Model	Serial Number	Calibration due
Sound level meter (SLM)	Rion NL-52	00375605	24/05/2019

**Table 3: Noise monitoring equipment details**

Measurements were conducted in accordance with AS1055.1-1997 *Acoustics - Description and measurement of environmental noise - General procedures*.

### Methodology – Meteorological Conditions

The noise limits in PA 11\_0060 apply only in wind speeds up to 3m/s. Meteorological data from NPM's weather station, corresponding with the entire monitoring period, is attached in Appendix C.

It is noted that noise limits apply during relatively calm conditions (wind speeds up to 3 m/s equates to 10.8 km/h). Where wind speeds have exceeded this limit, measurements are marked as being not applicable using "NA". Comparison with the documented limit should only be made when measurement of wind speed conforms to the maximum allowable wind speed.

### Observations

The noise output from the mine site was found to be continuous. No adjustments were required to the measured noise level for intermittent, tonal or impulsive characteristics. Additionally, the measurement points were chosen so that no adjustment was required for reflection or indoor measurement.

It is noted that at various times during attended monitoring, extraneous noise sources, i.e. sources other than the mine, were the primary contributor to measured noise levels. Commonly, these noise sources include wildlife (e.g. birds, frogs and insects), livestock (e.g. sheep and cattle), road traffic, overhead aircraft, farm machinery and vegetation noise (i.e. rustling of foliage). Where possible, extraneous noise was excluded from the result either by pausing the sound level meter until the extraneous noise event had ceased (such as for traffic or aircraft noise) or by removing the extraneous noise via frequency analysis – i.e. subtracting the contribution to the overall sound pressure level at key frequencies not related to noise emissions from NPM. Adjusting via frequency analysis is not possible with LA1 results.

Frequency analysis can only be utilised at frequencies where there is no overlap between the frequencies of NPM noise and extraneous noise. Peaks in the frequency spectrum of received noise are present but not caused by NPM noise (e.g. insect, frog and bird noise) at frequencies of approximately 2 kHz and above.

### Attended Noise Monitoring Results

Measurements conducted during excessive winds do not conform to the maximum wind speed requirements of PA11\_0060 and are not to be compared against the criteria. These levels are marked with the notation "NA" in the tables overleaf. Where noise levels have been adjusted due to the presence of extraneous noise such as insect or bird noise, these levels are marked with the notation "adj.". It is noted that during Q2 monitoring, no excessive wind speeds were recorded and no results required adjustment due to extraneous noise.

Table 6: Night Attended Noise Results

## 5. DISCUSSION

Measurements indicate compliance with the 15-minute  $L_{Aeq}$  limitation of 35 dB at all locations during conforming weather conditions.

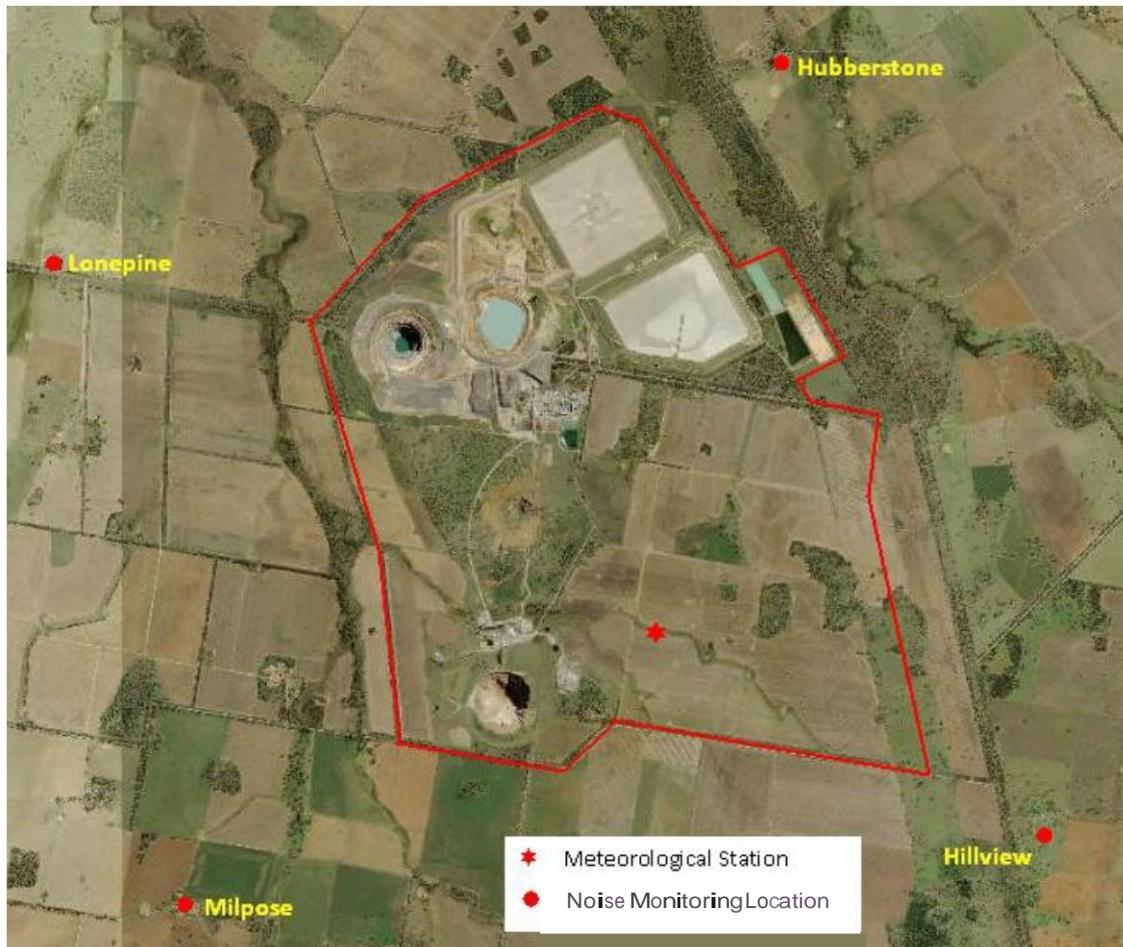

Where possible, extraneous noise sources have been excluded from attended measurements by pausing the sound level meter when non-NPM sources predominate (e.g. passing traffic or aircraft) and/or subtracting the component of the frequency spectrum that is caused by non-NPM sources (e.g. wildlife noise, livestock noise or foliage noise). Extraneous noise sources may contribute as much as 15 to 20 dB to the overall measured noise levels.

## 6. CONCLUSION

Attended environmental noise monitoring was conducted at four noise sensitive receivers around adjacent properties to Northparkes Mine site from the 20<sup>th</sup> to the 21<sup>st</sup> June 2018.

Attended noise monitoring results indicate noise emissions from the mine site comply with the Project Approval criteria.

The sound level meter submitted for testing successfully completed the class I periodic tests of IEC 61672-3:2006 for the environmental conditions under which the tests were performed.

As per the calibration certificate issued by NATA Accredited Laboratory, the sound level meter has been found to be fully compliant with the requirements of IEC 61672-3:2006. The sound level meter is recommended for use in Class I environments.
